Data Loss Prevention (DLP) Governance for Power Platform Environments

Created By
Divyani Rajani

What is Data Loss Prevention (DLP)?

Data Loss Prevention (DLP) in Microsoft Power Platform is a governance and security mechanism that manages how data is shared across connectors in Power Apps and Power Automate.

It enforces rules by classifying connectors as Business, Non-Business, or Blocked, ensuring secure usage within apps and flows.

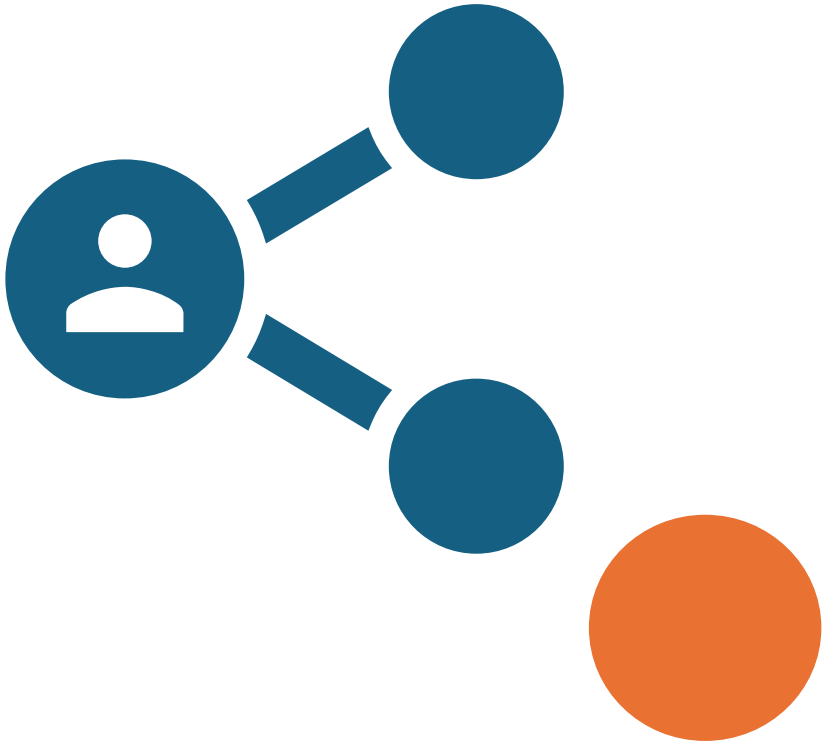
DLP is essential for protecting sensitive business data, controlling app behavior, and maintaining enterprise compliance.

Importance of DLP in Power Platform

- Ensures data confidentiality by preventing unauthorized access or sharing.
- Enforces compliance with regulations such as GDPR, HIPAA.
- Prevents mixing secure (Business) and unsecured (Non-Business)services in apps.
- Reduces risk of data breaches through low-code development misuse.
- Supports enterprise governance as Power Platform usage scales across departments.

Key DLP Capabilities

- Connector grouping: Classify connectors into Business, Non-Business, and Blocked.
- Policy application: Apply policies at environment level (Dev, QA, Prod & COE).
- Automation-friendly: Integrate with CoE tools for automated enforcement and alerts.
- Visibility: Full transparency via logs and usage reports.



Recommended DLP Policy Strategy for Power Platform Environments

DLP Policy Name	Applies to Environment	Purpose/Notes
DLP-DEV	Dev	Standard connectors by Microsoft + essential custom connectors
DLP-QA	QA	Mirrors PROD policy, restricts non-approved testing connectors
DLP-PROD	Production	Strictest policy; only essential business connectors allowed
DLP-COE	CoE	Includes connectors needed for admin/governance tools (e.g., CoE Starter Kit)
DLP-PAD-Migration	DEV, QA & Prod	Tailored for migration project, includes connectors like SQL, File System, RPA
DLP-Default-Environment	Default	Block high-risk and premium connectors, allow only standard Microsoft connectors
DLP-Teams-Environment	Microsoft Teams environments	Same as default with additional Teams-specific business connectors

Connector Classification Guidelines

Business Connectors (Allowed):

- All Microsoft-built connectors (Publisher = Microsoft, Class = Standard)
- Core business connectors (e.g., SQL Server, ServiceNow) — **on request basis**

Non-Business Connectors (Allowed, but isolated):

- Dataverse (used for segregation)

Blocked Connectors (Restricted):

- All others not falling into the above two categories (e.g., Facebook, Twitter, Mailchimp)

CoE DLP Implementation Best Practices

- ❑ Establish a baseline tenant-wide DLP policy from day one.
- ❑ Create custom policies per environment and region.
- ❑ Use clear naming conventions (e.g., DLP-Finance-Prod).
- ❑ Ensure only admins can modify policies.
- ❑ Include DLP awareness training in maker onboarding.

CoE DLP Policy – Connectors to be allowed

The DLP policy applied to your CoE Starter Kit environment needs to allow the following connectors to be used together in the business group:

- Approvals
- Azure Resource Manager
- HTTP
- HTTP with Microsoft Entra ID (preauthorized)
- Microsoft Dataverse
- Microsoft Dataverse (legacy)
- Microsoft Teams
- Office 365 Groups
- Office 365 Outlook
- Office 365 Users
- Power Apps for Admins
- Power Apps for Makers
- Power Automate for Admins
- Power Automate Management
- Power Platform for Admins
- Power Platform for Admins V2
- Power Query Dataflows
- RSS

DLP: A Foundational Layer for Secure Power Platform Adoption

Non-negotiable for enterprise security — ensures data protection and governance from day one

Aligns security, compliance, and business enablement across all environments

Supports innovation tools like **Copilot Studio**, **AI Builder**, and the **CoE Starter Kit** seamlessly

Enables secure scalability — empowering organizations to grow low-code adoption with confidence

THANK YOU!
